(Refer to Basic Connection and Instruction Manual)

DERATING CURVE

==NOTE==

- *1. Use an external fuse of fast blow type, for each unit.
- *2. When the input line impedance is high, insert input capacitor, C1, more than 220uF. (Refer to instruction manual)
- *3. Put an output capacitor. (5V: more than 470uF, 12V: more than 220uF, 15V: more than 220uF, 24V: more than 120uF, 28V: more than 100uF)
- *4. Set the minimum load current (more than 3% of rated current) in order to prevent recurrent output voltage dropout (due to continuous skip cycle) under dynamic load conditions.
- *5. Put an input common mode choke coil, L1, more than 1mH.
- *6. Refer to instruction manual for further details.
